About UV technology

UV technology deactivates bacteria, viruses and fungal spores and as a result renders them harmless.

The technology is primarily used in areas where there is a risk of microbiological contamination.

The main benefits of UV technology are:

- Effective against most viruses, spores and cysts including Cryptosporidium and Giardia
- Does not change the smell and taste of water
- There is no residual effect that can be harmful to humans or aquatic life
- UV disinfection is a physical process rather than a chemical disinfectant, which eliminates the need to generate, handle, transport, or store toxic/hazardous or corrosive chemicals

Due to vast variety of lamps and light source use in medical field, we are unable to list out all that is related.

However, if there are any lamps that are not found in this catalogue, please feel free to contact us.
